SUMMARY

MS Information Systems student with experience in AI-driven predictive modeling, supply chain analytics, and optimization-based decision support. Skilled in developing machine learning models, analyzing operational datasets, and translating model outputs into business recommendations. Research and project experience includes production scheduling optimization, supply chain relationship prediction, anomaly detection, and data-driven workflow automation.

EDUCATION

University of Utah <i>Master of Science in Information Systems</i> (GPA: 4.0)	Salt Lake City, UT Aug 2025 – Present
Incheon National University <i>Bachelor of Engineering in Industrial & Management Engineering</i> (GPA: 4.1 / 4.5)	Incheon, South Korea Mar 2019 – Aug 2025
Weber State University <i>Bachelor of Science in Management Information Systems</i> (GPA: 3.87)	Ogden, UT Jan 2024 – Apr 2025

TECHNICAL SKILLS

Programming Languages: Python, Java	Databases: PostgreSQL, MySQL
Data Analytics: R, Tableau, KNIME	Web Development: HTML, CSS, JavaScript
Data Visualization: Power BI	Project Management: Microsoft Project

PUBLICATIONS

- D. Lee, T. Noh, J. Go, et al., "ElectroTwin: A Digital Twin-Driven Framework for Designing and Scheduling of Electroplating Facilities," *International Journal of Precision Engineering and Manufacturing-Green Technology*, Mar. 2026.
- D. Lee, J. Go, T. Noh, et al., "Multi-feature Representation-based Graph Attention Networks for Predicting Potential Supply Relationships in a Large-scale Supply Chain Network," *Expert Systems with Applications*, May 2025.

EXPERIENCE

Teaching Assistant – Introduction to Operations and Supply Chain , University of Utah <i>Part-time Teaching Assistant</i>	Salt Lake City, Utah May 2026 – Present
- Supported instruction for core operations and supply chain topics, including global supply chain dynamics, value chain analysis, inbound logistics, process flow, inventory management, optimization, and project management. - Assisted students with analytical tools and applied assignments involving lead time analysis, process view mapping, inventory management, optimization, critical path analysis, decision trees, and process variability. - Helped evaluate coursework related to supply chain tracing, digital transformation, production and sustainability improvements, and data-driven operational decision-making.	
Teaching Assistant – Introduction to Data Analytics , University of Utah <i>Part-time Teaching Assistant</i>	Salt Lake City, Utah Jan 2026 – May 2026
- Guided students in data cleaning, visualization, predictive modeling, and interpretation of analytical results using Python-based analytics tools. - Supported students in translating model outputs into clear business insights through reports, presentations, and applied analytics projects. - Reviewed analytics projects for methodological soundness, data interpretation, model evaluation, and business relevance.	
Industrial Intelligence Laboratory , Incheon National University <i>Research Assistant</i>	Incheon, South Korea Nov 2022 – Jan 2024
- Developed an optimization-based production scheduling and decision support tool to simulate electroplating operations, evaluate resource requirements, and improve production planning efficiency. - Analyzed operational constraints, processing sequences, and equipment utilization to support data-driven resource planning decisions. - Improved operational efficiency by reducing required hoists by 25% and decreasing per-product processing time by 1.5% through optimized scheduling logic. - Co-invented and filed a Korean Patent (No. 10-2024-0007227) and published related research in the <i>International Journal of Precision Engineering and Manufacturing-Green Technology</i>.	

PROJECTS

AI-Based Insider Threat Detection Model

Apr 2026 – Present

- Developing an AI-based anomaly detection model using the CERT insider threat dataset to identify abnormal user behavior from structured activity records.
- Designed a multimodal feature embedding pipeline using BERT for text, sine/cosine encoding for temporal variables, and binary encoding for indicator variables.
- Built an Autoencoder + MLP baseline model using reconstruction error for anomaly detection and evaluated thresholds based on $\mu + 3\sigma$ and 99th percentile criteria.

Graph Attention Network (GAT) – based Supply Chain Relationship Prediction Model

Jan 2024 – Sep 2024

- Developed a Graph Attention Network-based link prediction model to identify hidden inter-company supply chain relationships using node features and text embeddings.
- Demonstrated strong predictive performance with an average accuracy of 84% across multiple datasets
- Published research in *Expert Systems with Applications* based on the proposed GAT model

COMPETITIONS

ChatGPT Hackathon: AI Agent System for Workflow Automation, University of Utah

Apr 2026

- Developed an AI-agent system to automate operational workflows, including meeting summary generation, follow-up action extraction, email drafting, and calendar scheduling.
- Designed a workflow that converts unstructured meeting notes into structured tasks, improving task tracking and administrative efficiency.
- Applied LLM-based automation to support business process optimization and reduce manual coordination work.

Gen AI Hackathon: AI-Powered Community Health Ordering & Fulfillment System, University of Utah

Mar 2026

- Developed an LLM-powered web application to modernize community health request intake, fulfillment routing, and administrative review workflows.
- Automated urgency assessment and request summarization to highlight event details, key considerations, incomplete information, and required follow-up actions.
- Built an administrator-facing dashboard to track request status, fulfillment type, event details, and workflow progress.

1st Place – 2025 KPMG Layton Data Analytics Challenge, University of Utah

Nov 2025

- Built an interpretable predictive model using Explainable Boosting Machine to identify key drivers of workforce-related business outcomes.
- Conducted demographic and workforce analysis to translate complex employee data into actionable business insights.
- Designed an interactive dashboard and stakeholder-facing presentation to communicate model findings, trade-offs, and data-driven recommendations.

2nd Place – 2024 Game Day Analytics Challenge, University of Utah

Feb 2024

- Analyzed large-scale social media data to evaluate advertising effectiveness, brand impact, and audience response patterns.
- Conducted time-series, sentiment, and cost-effectiveness analyses to compare campaign performance across brands.
- Applied the Analytic Hierarchy Process (AHP) to integrate multiple performance metrics into a unified decision-support ranking.
